Subject:

09/643,755

Could you please do sequence searches of SEQ ID 1, 2, and 3 of this case, 09/643,755.

SEQ ID 1 and 3 are DNA. SEQ ID 2 is protein.

Could you also do an oligo search of SEQ ID 1 and 3.

The commercial and inhouse databases.

Thanks in advance for you assistance.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thallana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Producing chymosin in seeds of plants such as rice, flax, rape seed, transforming plant cell with a nucleic acid encoding chymosin operable linked to transcription regulator and terminator sequences -

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.
                                                                                                                           1794

This could overcome the shortage of prochymosin due to shortage of calf stomachs and increasing chees prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk.                       The DNA is that of a mammalian gene (open reading frame) encoding chymosin. The gene was placed in operable linkage with the al-3 promoter (see AAT03005). The al-3 gene controls the production of geranyl geranyl pyrophosphatase (GGPP) synthetase. GGPP is a precursor for carotenoids and xanthophylls. It has been shown that exposure to light increases the transcription level of GGPP synthetase 15-45 fold. Light activates a number of genes in the common bread mould, Neurospora. This can be used to regulate the expression of genes encoding heterlogous proteins, e.g. chymosin, in recombinant production systems. Use of a light-regulated promoter is a simple and effective way to control expression and allows timing to be adapted to the physiological status of the host.
                                                                                                                                                                                                               Nucleic

GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast of the recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, bovine growth hormone, interferon, prorennin or preprotennin, in yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ATCC 20643 20661, 20662 and 20663, strain designations CGY 196, 457, 461 and the strain designations CGY 196, 457, 461 and the strain designations CGY 196.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA segmer

Any portion of the nucleotide sequence as described in AAN40055 can be used. Also claimed is a vector derived from plasmid pBR322. Typically plasmid pCR501 is obtd. from pOCT 2. The transcriptional direction of pOCT 3 is opposite to that of pOCT 2; it is clockwise in pOCT 3.

                                                B.napus plants.

CB.napus plants.

Chie DNA which encodes a chimeric fusion protein that consists of the coil-body targeting sequence, a transcription regulation sequence and the protein of interest can be used to produce antibodies, glycanases, hormones, proteases, protease inhibitors, seed storage proteins, thrombin inhibitors, hirudin, interleukins, chymosin, cysts cylanase, carp growth hormone, zein or a collagenase.

Che enzyme may be cleaved from the oil body protein or used in association with the oil body fraction.

Allows production by conventional systems. The expressed heterologous protein can be easily separated from host cell components due to the use of the oil body as a carrier protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the nucleotide sequence of a HindIII fragment containing the oleosin-spacer-Met-prochymosin sequence. This HindIII fragment was joined to a nopaline synthase terminator and cloned into binary vector pCGN1559. The resulting plasmid was called pSBSOTPTNT and introduced into A.tumefaciens. The resulting bacterial strain was used to transform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expression of a heterologous useful for the production of

```

It was used as heterologous peptide/protein together with parts of the alpha-S1-casein gene in the produ. of DNA constructs. The heterologous peptide or protein may also be human insulin-like growth factor I. The constructs provide high yields of the protein with simple recovery from the milk. Activation of the gene occurs only in the mammary gland See also AAQ14050, AAQ14774-77.
